

Wipro's Water Management Tool

Wipro's advanced analytics models help clients in identification of wells with higher water cut rate hence affecting the bottom line. The Water Management Tool aims at optimizing asset performance and minimizing the impact on bottom line by providing insights on wells with higher water cut rate, which are taken for maintenance or work-over jobs with minimum productivity loss.

Well and reservoir characteristics mapped to facility resulting in delivering accurate current and future operating state of the asset

Reduce OPEX for handling excess water produced that is more than the buffer storage capacity of the facility and is non-economical

Optimize asset performance with integrated view from sub-surface to facility

Eliminate surprises due to dynamic formation behavior and effectively handle your production

Optimize asset performance with integrated view from sub-surface to facility

Features

Benefits

- Minimizes the efforts to decide on the wells to shut due to unexpected water cuts which cannot be buffered in the facility
- Reduces cost of oil production due to increased water production that can be used as an input for feasibility study for facility expansion
- Simplifies the process of networks and facility management
- Leverages 'Proposed Work-over' input for each well in order to get it prioritized for shutdown or further action
